

RapidSOS Portal is now RapidSOS Emergency Response Data Platform

RapidSOS has built the world's first platform for first responders to access life-saving data for emergencies in real-time. The RapidSOS platform connects some of the world's largest companies and organizations directly with public safety by sharing data from their connected devices, platforms, and sensors whenever their customers or employees need emergency assistance.

*The new platform is already integrated into the 9-1-1 call handling equipment; no action needs to be taken at the PSAP level.

What is the emergency response data platform?

The emergency response data platform is a clearinghouse through which emergency data is securely shared from connected devices, platforms, and sensors to first responders and public safety software. It sends a variety of different types of real-time, incident-specific data such as:

- Device location
- User profiles
- Security system alarm information
- Medical and health information
- Auto accident and telemetry data
- COVID-19 symptom and test results
- And more

*For more information check out the [RapidSOS website](#)
